

Cascaded Kerr bistability ($\Delta\omega/\gamma_2 = 5.0$, $\delta_1/\gamma_2 = 0.8$, blue-detuned). Panels (c,d) validate the $1/(1+R)$ threshold scaling across a range of R .

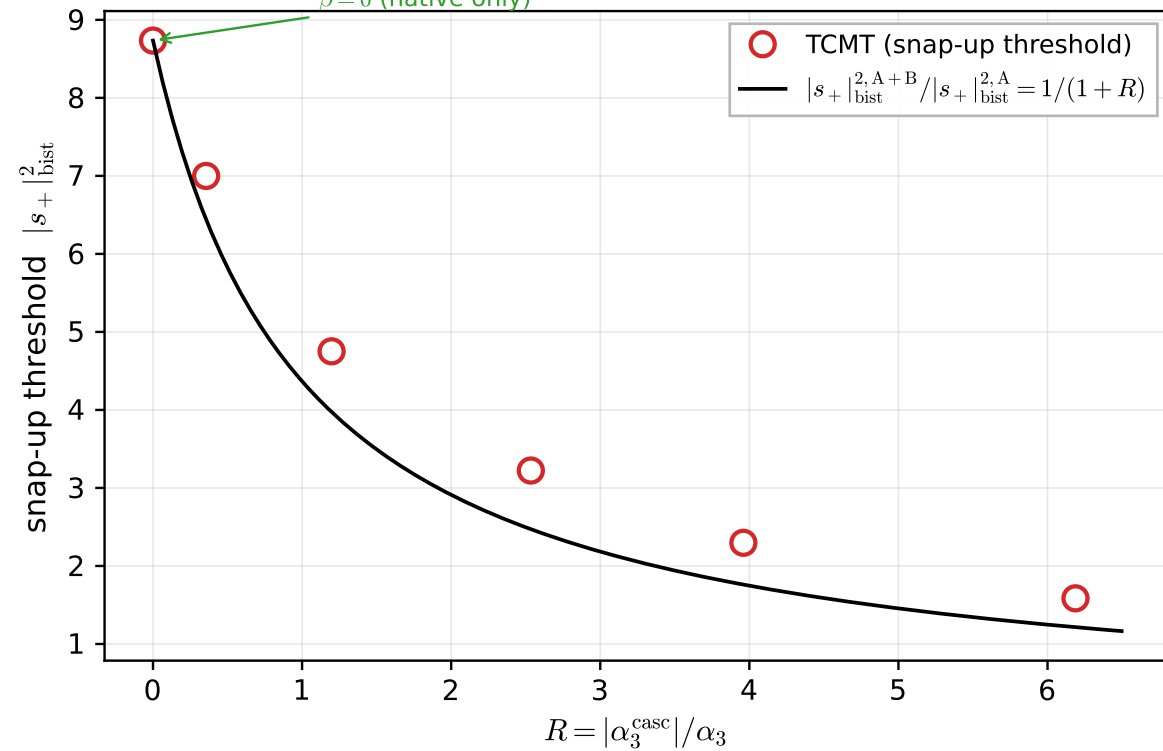

(a) FM hysteresis loop

(b) SH amplitude jumps in lockstep with FM

(c) Threshold drops as $1/(1+R)$ (cascade vs native, same α_3)

(d) Normalised view: orders-of-magnitude drop on log axis
